Nicolas Weht

Senior Data Engineer

Córdoba, Argentina (remote) nicoweht@gmail.com +54 9 351 302 2428 linkedin.com/in/nicolasweht

SUMMARY

Data Engineer with 5+ years building production data pipelines in Python and SQL: ELT, third-party integrations and warehouse modeling on Snowflake, BigQuery and PostgreSQL, with dbt and Airflow. I focus on data integrity and automation: I root-cause silent data loss from production evidence, fix it with tested, reviewed changes, and work daily in English (C1) with engineering, product and business teams.

EXPERIENCE

Customer Success Engineer - Data Engineer | Hectre | Auckland, NZ (remote) January 2026 - October 2026

- Built and ran Python data services on AWS (Lambda in a private VPC, EventBridge, Secrets Manager, CloudWatch; psycopg, boto3, Slack API) that query PostgreSQL and deliver scheduled reports to 50+ customer channels; cut per-tenant query time from over 3 min to under 1 s and fixed a duplicate-run incident traced in CloudWatch to a timeout plus async retry.
- Led the migration of three production Lambdas from Python/SAM to TypeScript and AWS CDK: byte-identical output, a 223-test suite with mutation testing, controlled cutover through the deployment pipeline, and resolution of seven post-release issues.
- Owned data integrity for an event-sourced, multi-tenant pipeline (event publisher, SQS, Aurora data lake). Traced a platform-wide silent drop of every new bin after an event-contract change (V6 to V9) and shipped a backward-compatible fix validated with zero key changes across 5.28M historical rows.
- Found ~10,080 receiving loads across ~30 accounts silently hidden for two months by a delete-cascade defect and recovered them with a tenant-safe fix reconciled exactly against the data lake; traced duplicate scan records (43,700 duplicate groups across 65 tenants) upstream to non-atomic check-then-insert ingestion Lambdas.
- Root-caused a payroll outage affecting ~530 tenants to a NULL window-function partition key in a five-layer materialized-view chain; validated the fix read-only end to end (0 to 51,265 timesheets recovered) and assessed downstream impact before release.
- Optimized PostgreSQL/Aurora for analytics workloads: a critical query from ~9.9 s to ~80 ms (autovacuum lag on a 6M-row table), an extraction from 73 s to 20 s with index-aware SQL, and a revenue calculation moved into a scheduled materialized view (refresh from 15+ min to 40 s, data lag from 7 days to 1 day).
- Restored stalled production data refreshes by isolating an expired API credential, and wrote a triage runbook separating credential, certificate, capacity and disk failures; cut Microsoft Fabric capacity utilisation to ~50% after diagnosing the load pattern.
- Wrote Python tooling to parse and audit semantic-model definitions (JSON/TMDL), scoping 146 measures down to the 47 in use, and prototyped an LLM data assistant in Python (Claude tool use, Slack) with SQL allow-listing, a read-only role, audit logging and a tenant-isolation design reviewed by engineering.
- Built 20+ metrics and semantic-layer features in the in-house analytics platform (TypeScript backend; test suite from 3,380 to 5,400+ tests) and fixed a CI workflow that had silently skipped lint and tests on every PR.
- Primary technical contact for Customer Success on critical tickets; delivered root-cause reports, runbooks and handoff documentation, and set least-privilege, read-only production database access practices.

Data Engineer | Quales Group | Argentina (remote) November 2024 - December 2025

- Designed and maintained ELT workflows in Snowflake and BigQuery, supporting accurate and consistent financial and operational reporting.
- Built and maintained dbt Cloud data models with git-based version control, testing and documentation to standardize data from multiple sources and improve reliability and scalability.
- Orchestrated multi-step pipelines with Apache Airflow DAGs and automated ingestion from third-party systems and integrations with Workato, improving data freshness and reducing manual intervention.
- Investigated discrepancies with finance, audit and operations teams; delivered Power BI semantic models and DAX measures for executive KPI analysis across regions.

Data Analyst - Engineer | Priority One Solutions | Auckland, NZ — November 2023 - September 2024

- Built and maintained a production Fabric Lakehouse with raw, staging, silver and curated layers (medallion), ingesting SFTP exports and SharePoint data via scheduled pipelines, copy jobs and the Microsoft Graph API.
- Implemented schema drift detection, deduplication of overlapping delta loads and data quality checks to improve pipeline reliability.
- Managed secrets with Azure Key Vault and Entra app registrations; troubleshot pipeline failures and reconciled source exports against curated tables across 30+ sources.
- Built Python and SQL transformations and reporting on top of the Lakehouse (Power BI Direct Lake, Power Automate).

Business Intelligence Developer | Morgan Project Services | Auckland, NZ — March 2023 - November 2023

- Optimized ETL processes and ERP query efficiency by 30%; restructured datasets, cutting load times by over 90%.
- Built Power BI dashboards tracking 24+ KPIs and SSRS reports for 150+ users.

Business Intelligence Analyst | Voicenter Argentina | Córdoba — January 2022 - December 2022

- Built SQL-driven Power BI reporting and automated processes, reducing manual reporting effort by 75%.

SKILLS

Python & Languages	Python (psycopg, boto3, pandas, pytest, slack_sdk), SQL, TypeScript; REST APIs (Microsoft Graph, Slack), third-party integrations
Data Engineering	ETL/ELT, data modeling and warehousing, medallion architecture, data quality and reconciliation, schema drift handling, deduplication, performance tuning, root cause analysis
Platforms	Snowflake, dbt Cloud, BigQuery, PostgreSQL/Aurora, Apache Airflow, Microsoft Fabric, Workato
Cloud & DevOps	AWS (Lambda, CDK, EventBridge, CloudWatch, IAM, Secrets Manager), Azure Key Vault, Docker, Git/GitHub, code review, CI/CD, automated testing, documentation
BI	Power BI, DAX, Power Query, semantic modeling, incremental refresh, row-level security

PROJECTS

Finance Request Power Platform App | Coca-Cola — January 2025 - July 2025

- Built an integrated finance request and reporting solution using Power Apps, Dataverse, Power BI and Power Automate to support financial request workflows across organizational units and the Finance team.
- Developed a Power BI semantic model and three reports embedded in Power Apps, using Dataverse DirectQuery across DEV, UAT and PROD environments to provide visibility into request status and financial KPIs.

CERTIFICATIONS

Power Platform Fundamentals | Microsoft | 2024 · **Power BI** | UTN INSPT | 2022 · **SQL** | Coderhouse | 2022
